

Take-Private Reverse LBO & Probabilistic Underwriting | Project Redwood

Private Equity / Investment Banking project overview

What it is

A fictional PE take-private case study combining an Excel LBO model, reverse-LBO bid ceiling, hurdle solver and Python probabilistic underwriting engine.

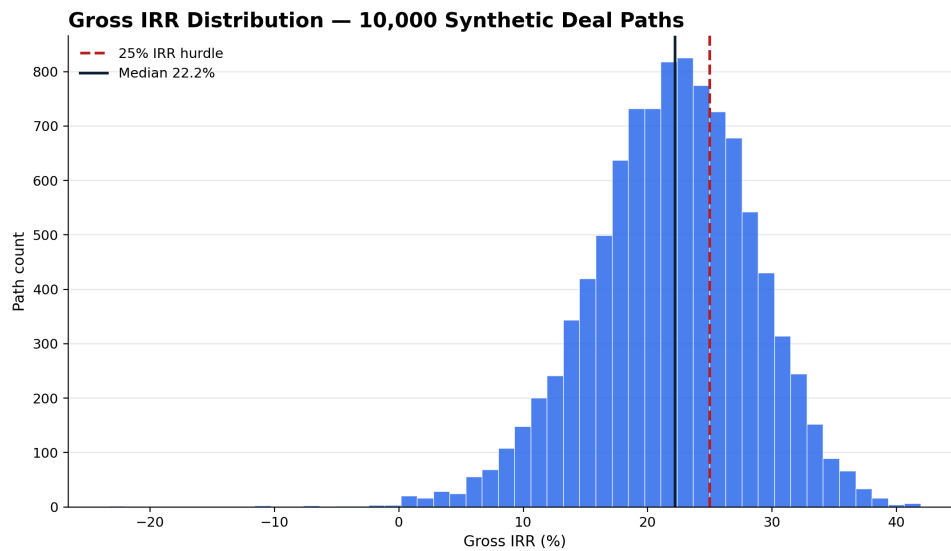

Headline outputs

- Seller ask: 8.5x EBITDA
- Base-case gross IRR / MOIC: 22.3% / 2.74x
- Deterministic max bid: 8.1x
- $P(\text{IRR} \geq 25\%)$ at ask: 32.9%

Why it stands out

Instead of stopping at a single LBO output, the project asks what price is actually underwritable and how likely the deal is to clear sponsor hurdles under uncertainty.

The repository also includes a browser dashboard where assumptions can be changed interactively and the charts update immediately.
